I am a biologist with specialization in environmental biology, more specifically botany. I am working currently in the area of agriculture and horticulture sciences. I prefer field work, connected with vegetation analyses. My research focuses on invasive species, particularly plants. I analyze their environmental impact, methods of elimination, and possibilities of habitat restoration, particularly in case of grassland habitats. I also study methods for preserving the biodiversity of meadows and pastures.

I cooperate with farmers, as well as conduct my projects on protected areas: Karkonosze National Park and Stolowe Mountains National Park. Recently my research is connected with city greenery, and possibilities of enriching the ecosystem services served by city grasslands due to biodiversity maintenance and human well-being.
