PhD topic:	Nanoscaled theranostic biomaterials as therapeutic platforms for bone and cartilage tissue functional regeneration.
Research discipline in Doctoral School:	Biological Sciences
Short description of the research problem to be solved in the PhD (minimum 1000 characters):	The thesis aims to determine the biocompatibility of novel nanoscaled biomaterials with theranostic properties in terms of their pro-osteogenic and pro-chondrogenic potential. The biomaterials will be organic-inorganic hybrids, formed by bioactive polymers with nanosized phosphate-silicate compounds of apatite structure. The study will evaluate biomaterials' influence on endochondral bone formation at the cellular and molecular levels. Thus the analysis will be performed using sophisticated in vitro models (3D cultures) and in vivo models (humanised mice). The signalling pathways of critical bone and cartilage formation regulators will be studied using functional assays to determine the potential molecular mechanism of biomaterials action. The molecular axis of master regulators will be determined based on the profile of coding and non-coding transcripts. Immuno-based techniques will monitor the expression of relevant extracellular and intracellular proteins. The cytocompatibility of biomaterials will be evaluated using cells of high cellular plasticity, i.e. bone marrow-derived mesenchymal stromal cells. The result of the thesis will be the profound characterisation of nanosized biomaterials with great emphasis on understanding the molecular mechanism of the theranostic platforms' action. The PhD student will be involved in the realisation of convergent research tasks in the OPUS 22 project titled: Biocompatible materials with theranostics' properties for precision medical application (UMO-2021/43/B/ST5/02960) lead by Prof. Wiglusz. The student will get an additional scholarship (around 550 PLN/1 month; planned for 24 months)
Professional skills for PhD candidate (e.g. master program, specializations, softwares, language, analytical techniques, minimum 500 characters):	Qualifications & Skills: • Master's degree in biology or similar; • fluency in spoken and written English; • experience in working with cell/tissue cultures and biomaterials testing; • at least basic knowledge regarding molecular-based techniques; • experience with animals; handling and in vivo studies will be much appreciated; • knowledge of general basic statistical programs and methods; • good general IT skills (e.g. MS Office: Excel, MS Word, or similar); Core Competencies: • commitment and availability in research work; • communication skills; • ability to work in a team; • the ability to organise work and the desire for continuous scientific development; • pro-active attitude, flexible, professional.
a) Project title:	none
b) Agreement number:	none
c) Number of months in the project to support PhD (in months; starting from 1st of October 2022):	0
